# Tropical Storm JANGMI

TROPICAL STORM 06W (JANGMI) WARNING NR 029  
01 ACTIVE TROPICAL CYCLONE IN NORTHWESTPAC  
MAX SUSTAINED WINDS BASED ON ONE-MINUTE AVERAGE  
WIND RADII VALID OVER OPEN WATER ONLY  
---  
WARNING POSITION:  
030600Z --- NEAR 34.9N 141.4E  
MOVEMENT PAST SIX HOURS - 075 DEGREES AT 30 KTS  
POSITION ACCURATE TO WITHIN 060 NM  
POSITION BASED ON CENTER LOCATED BY A COMBINATION  
SATELLITE AND RADAR  
PRESENT WIND DISTRIBUTION:  
MAX SUSTAINED WINDS - 050 KT, GUSTS 065 KT  
WIND RADII VALID OVER OPEN WATER ONLY  
BECOMING EXTRATROPICAL  
RADIUS OF 050 KT WINDS - 040 NM NORTHEAST QUADRANT  
065 NM SOUTHEAST QUADRANT  
040 NM SOUTHWEST QUADRANT  
090 NM NORTHWEST QUADRANT  
RADIUS OF 034 KT WINDS - 180 NM NORTHEAST QUADRANT  
210 NM SOUTHEAST QUADRANT  
165 NM SOUTHWEST QUADRANT  
125 NM NORTHWEST QUADRANT  
REPEAT POSIT: 34.9N 141.4E

# Tropical Storm AMANDA

WS National Hurricane Center Miami FL EP012026  
00 AM PDT Thu Jun 04 2026

..SATELLITE WIND DATA INDICATE THAT AMANDA HAS CHANGED  
IN STRENGTH...

SUMMARY OF 200 AM PDT 0000 UTC INFORMATION

LOCATION...12.2N 129.8W  
ABOUT 1500 MI...2415 KM WSW OF THE SOUTHERN TIP OF BAJA  
MAXIMUM SUSTAINED WINDS...40 MPH...65 KM/H  
PRESENT MOVEMENT...NW OR 305 DEGREES AT 8 MPH...13 KM/H  
CENTRAL PRESSURE...1006 MB...29.71 INCHES

— *Journal of the American Medical Association*, 1997

## What Is a Hurricane?

A hurricane (or typhoon, or severe tropical cyclone), the strongest storm on Earth, is a cyclonic (rotary) storm that derives its energy from cloud formation and rainfall, unlike frontal cyclones that derive their power from a temperature gradient.

A hurricane begins as a tropical depression with a sustained wind speed of less than 39 mph (35 knots; 63 km/hr). As the system strengthens, it becomes a tropical storm with winds from 39 to 73 mph (35-63 knots; 63-118 km/hr). Tropical storms are named in the Atlantic, East, Central and Northwest Pacific, in the South Indian Ocean, and in the Arabian Sea. When the winds are sustained (based on a one-minute average) at 74 mph (64 knots; 119 km/hr), the storm becomes: In the Atlantic Ocean, East Pacific, Central Pacific (east of the International Dateline) and Southeast Pacific (east of 160°E) a **Hurricane**; in the Northwest Pacific (west of the International Dateline) a **Typhoon**; in the Southwest Pacific (west of 160°E) and Southeast Indian Ocean (east of 90°E) a **Severe Tropical Cyclone**; in the North Indian Ocean a **Severe Cyclonic Storm**; and in the Southwest Indian Ocean (west of 90°E) a **Tropical Cyclone**.

## The Saffir-Simpson Hurricane Scale

**Category 1** – 64-82 knots (74-95 mph; 119-153 km/h). Damage is limited to foliage, signage, unanchored boats and mobile homes. There is no significant damage to buildings. The main threat to life and property may be flooding from heavy rains.

**Category 2** – 83-95 knots (96-110 mph; 154-177 km/h). Roof damage to buildings. Doors and windows damaged. Mobile homes severely damaged. Piers damaged by storm surge. Some trees blown down, more extensive limb damage.

**Category 3** – 96-112 knots (111-129 mph; 178-208 km/h). Major Hurricane. Structural damage to some buildings. Mobile homes are completely destroyed. Roof damage is common. Storm surge begins to cause significant damage in beaches and harbors, with small buildings destroyed.

**Category 4** – 113-136 knots (130-156 mph; 209-251 km/h). Structural failure of some buildings. Complete roof failures on many buildings. Extreme storm surge damage and flooding. Severe coastal erosion, with permanent changes to the coastal landscape not unheard of. Hurricane force winds extend well inland

**Category 5** – 137+ knots (157+ mph; 252+ km/h). Complete roof failure on most buildings. Many buildings destroyed, or structurally damaged beyond repair. Catastrophic storm surge damage. In the Northwest Pacific, a typhoon that reaches 150 mph (241 km/hr) is called a Super Typhoon.

| SAFFIR-SIMPSON SCALE |         |         |         |              |
|----------------------|---------|---------|---------|--------------|
| Category             | Knots   | MPH     | KM/H    | Damage       |
| 1                    | 64-82   | 74-95   | 119-153 | Minimal      |
| 2                    | 83-95   | 96-110  | 154-177 | Moderate     |
| 3                    | 96-112  | 111-129 | 178-208 | Extensive    |
| 4                    | 113-136 | 130-156 | 209-251 | Extreme      |
| Super Typhoon        | 130+    | 150+    | 241+    | Catastrophic |
| 5                    | 137+    | 157+    | 252+    | Catastrophic |

## Storm Surge

Historically, storm surge is the primary killer in hurricanes. The exact storm surge in any given area will be determined by how quickly the water depth increases offshore. In deep-water environments, such as the Hawaiian islands, storm surge will be enhanced by the rapidly decreasing ocean depth as the wind-driven surge approaches the coast. The peak storm surge is on the right-front quadrant (left-front in the Southern Hemisphere) of the eyewall at landfall, where on-shore winds are the strongest, and at the leading edge of the eyewall. Contrary to a popular myth, the storm surge is entirely wind-driven water—it is not caused by the low pressure of the eye. Another factor in the severity of the storm surge is tide. Obviously, an 18-foot storm surge at high tide is that much worse than an 18-foot surge at low tide.
